

What the Looming Debt Ceiling Deadline Means for Investors

Jeff Schnobelen | jeff@rfswealth.com | May 10, 2023

"...investors should focus on what they can control in order to differentiate how things work from how they would like them to be."

The federal debt limit is once again in the news as the country rapidly approaches a critical deadline on June 1. Investors are understandably nervous about Washington failing to reach an agreement, a possibility that both sides agree would be a self-inflicted catastrophe. While it's unclear how this will play out in the coming weeks, the fortunate news is that financial markets are mostly taking these events in stride. How can investors maintain the right perspective around political and fiscal uncertainty?

Federal borrowing reached the debt limit this past January

First, it's important to understand what the debt limit is and is not. In simple terms, the federal government borrows money to pay its bills by issuing Treasury securities. This is necessary because the federal government often operates with a deficit whereby spending exceeds government revenues. While tax revenues increase as the economy grows, they have been outpaced by spending over time. This borrowing adds to the national debt which hit the \$31.4 trillion debt ceiling in January. Since then, the Treasury Department has been employing what it calls "extraordinary measures" to ensure that the country does not default on its obligations.

The debt ceiling is a mechanism that requires Congress to approve additional borrowing above these levels. What makes this discussion confusing is that the debt ceiling is not about government spending per se. That spending has already been authorized through the normal budget process that takes place each year.

Therefore, the only question around the debt ceiling is whether the government can and should pay its bills. This is akin to signing the papers for a new car then afterwards requesting an increase to your credit limit. For most of us, the decision to buy something can't be separated from whether we will pay for it, even if it's with debt. Unfortunately, the Congressional process for approving a budget by September 30 each year is separate from whether the Treasury can actually pay the bills.

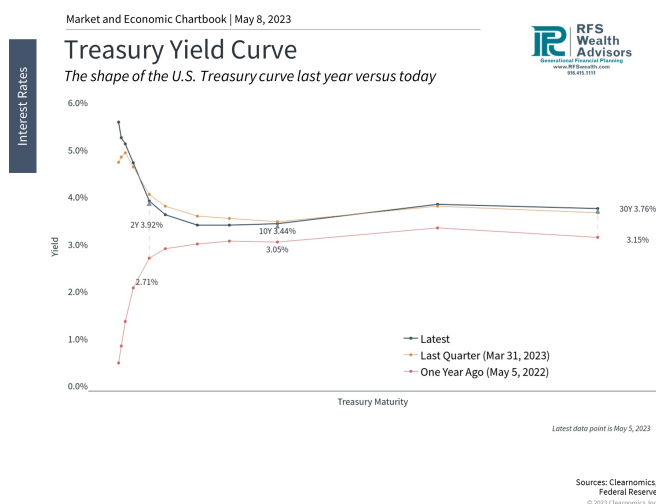

Near-term Treasury rates have jumped but longer-term rates are steady

Second, the large and ever-growing national debt is a controversial topic that impacts the economy and markets in complex ways. At the moment, Democrats, who control the White House and Senate, and Republicans, who control the House of Representatives, are in a standoff. On April 26, the House passed a debt limit bill by a narrow vote margin of 217 to 215. This would increase the debt limit through March 31, 2024 or until the national debt increases by another \$1.5 trillion.

However, it also includes provisions such as discretionary spending limits, the repeal of renewable energy tax credits, increased work requirements for benefits programs, and others. This makes it politically fraught and thus unlikely to pass the Senate and be signed into law.

As usual, there is plenty of political grandstanding around this issue with each side trying to gain the upper hand. Similar debt ceiling standoffs have occurred over the past decade with the limit suspended and raised in 2013, 2014, 2015, 2017, 2018, 2019 and 2021. According to the Congressional Research Service, the debt ceiling has been raised 102 times since World War II.

Fortunately, despite the headlines and investor concerns, these episodes had little long-term impact on markets. The U.S. has never defaulted on its debt, and nearly all economists and policymakers agree that doing so would lead to turmoil in the financial markets and increase borrowing costs for businesses and everyday citizens. This risk is evident in the bond market with a sharp jump in Treasury rates with maturities around the debt ceiling deadline, and much lower rates thereafter.

Income tax rates are still low by historical standards

Third, debt ceiling aside, the national debt at today's level means that it has more than doubled over the past decade and, with very few exceptions, has grown nearly every year over the past century. While everyone generally agrees that the government should not spend more than it generates in tax revenues, the unfortunate reality is that neither party has addressed the problem over the past decade. The last balanced budgets occurred during the Clinton years and the Nixon administration before that.

So, deficits are unlikely to go away. Given how heated the topic of government spending can be, it's important for investors to distinguish between their political feelings and how they manage their portfolios. In other words, investors should focus on what they can control in order to differentiate how things work from how they would like them to be.

The bottom line? The debt ceiling and federal debt need to be resolved in the coming weeks. As with many political issues, it's important for investors to separate their concerns and not react with their hard-earned savings and investments. History shows that staying invested is the best approach to navigating drama in Washington.
